                                                                                                                                                                                                                                                     A DNA molecule (AAT3358) codes for a protein (AAW02303) that confers on Mycobacterium tuberculosis an ability to survive within macrophages. It is a fragment of a larger molecule (AAT3355) obtd. by ligating M. tuberculosis genomic DNA fragments into pBluescript II vector and screening recombinant E. coli strains for HeLa cellinvasive clones. It can be incorporated into a vector and used for prodn. of recombinant macrophage survival protein, which is useful in vaccines or for facilitating uptake of other materials, e.g. therapeutic genes, into mammalian cells. A second DNA molecule tuberculosis the ability to enter mammalian cells.
                                                                                                                                                                                                                Mycobacterium tuberculosis DNA - confers ability to enhance uptake of therapeutic agents e.g. antibiotics, also useful in vaccines

The present sequence encodes a Mycobacterium tuberculosis cellular uptake protein fragment, which confers on M. tuberculosis an ability to survive within macrophages.

The protein can be used in a vaccine to prevent M. tuberculosis infection, and provide for the uptake in cells of, e.g. antibiotics, DNA fragments or anti-neoplastic agents. Antibudies raised against it can be used to treat mammals already exposed to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     tuberculosis, to induce a passive immunity and prevent disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA encoding for cellular uptake of Mycobacterium tuberculosis used to develop prods for vaccines, passive immunisation and diagnosis and cellular uptake of other materials
                                                                                                                                                                                                                                                                                                                                                                                           .

A DNA molecule (AAT33656) confers on Mycobacterium tuberculosis an ability to enter mammalian cells and to survive within macrophages. The enter macrophages and to survive within macrophages. It is sequence is given in AAM02301. The DNA was obtd. by ligating M. tuberculosis genomic DNA fragments into pBluescript II vector and screening recombinant E. coli strains for HeLa cell-invasive clones. The DNA includes 2 separate coding regions (see also ART33657-58) coding for the cell entry (AAM02302) and macrophage survival (AAM02303) proteins. It can be used to produce the cellular uptake proteins used as vaccines or to facilitate uptake of other
                                                                                                                        Sequence 1535 BP; 297 A; 544 C; 458 G; 236 T; 0 other;

    macrophages. It encodes a polypeptide having a mol. wt. of about 50°55 kDa, pref. 52 kDa. The AA sequence represents a highly hydropholic perion at its carboxy terminus. It could be a secreted protein, a cytoplasmic protein, or a surface protein with its carboxy terminus attached to the outer membrane of the organism. The deduced AA sequence is in AAR71931.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA giving M. tuberculosis ability to enter mammalian cells and/or survive within macrophage(s), useful in vaccines to protect mammals against Mycobacterium tuberculosis infection

                                                                                                                            ;
                                                                                                                                               This DNA sequence comprises Mycobacterium bovis BCG deletion sequence BCGdelta3. A specific genetic deletion of this region results in an avirulbance phenotype of the mycobacterium. 2 other deletion regions (see AAT33535 and AAT33536) have also been detected. Identification involved screening a BCG cosmid library with a
                                                                                                                             Gaps
ability to enter mammalian cells and to survive within macrophages. The protein can be used in a vaccine to prevent M. tuberculosis infection, and provide for the uptake in cells of, e.g. antibiotics, DNA fragments or anti-neoplastic agents. Antibodies raised against it can be used to treat mammals already exposed to M. tuberculosis, to induce a passive immunity and prevent disease

radiolabeled probe obtained following DNA subtraction between virulent Mycobacterium tuberculosis H37Rv and avirulent BCG. The deletions provide useful markers for the identification of an avirulent, or a virulent, mycobacterial phenotype. Determination of avirulence requires the detection of the presence or absence of presence or absence of deletion junctions (see AAT33538-46), or by detecting the presence or absence or absence or absence of the presence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Yokoi

are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lygine. The present sequence is a nucleic acid described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                         Corynebacterium glutamicum MP protein nucleotide sequence SEQ 1D NO:411

AAF71753 to AAF7.230 encode the Corpuebacterium qlutamicum metabolic pathway (MP) proteins given in AAB79634 to AAB80211. The C. glutamicum MP nucleic acids are useful for the production of fine chemicals in microorganisms, including organic acids, nonproteinogenic amino acids, purine and pyrimidine bases, nucleosides, nucleotides, lipids, saturated and unsaturated fatty acids, diols, carbohydrates, aroundic compounds, vitamins, cofactors, polyketides and enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acids from Corynebacterium glutamicum encoding metabolic pathway proteins, useful for producing fine chemicals in microorganisms, including organic acids, nonproteinogenic amino acids, and purine and pyrimidine bases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0;

                                                                                                                                                                                                                                                                                                                                          Bordetella pertussis possesses a type III secretion system. Type III secretion systems allow bacteria to target virulence factors directly at host cells. The present sequence is a coding sequence of B. pertussis. No name has been specified for the present sequence. The present sequence may be a housekeeping gene. A pathogenicity island is a compact, distinct genetic unit carrying virulence genes. The present sequence is located within a pathogenicity island (see AAA64890) which also carries, a number of genes encoding proteins involved in the type III secretion system of B. pertussis. See AAA64849. And ABA111-B14146 for details of the coding sequences and proteins identified in the pathogenicity island, of the present invention.
                                                Type III secretion system; virulence factor; pathogenicity island; ss.

2 Polynucleotides (AAT72684 and AAT72685) represent 2 distinct clusters of genes encoding enzymes (AAW19734-36 and AAW19737-42) involved in sugar biosynthesis and attachment in Saccharopolyspora erythraea. The eryB genes are involved in the biosynthesis of L-mycarose and the eryC genes involved in the biosynthesis of D-desosamine. Worel glycosylation-modified polyketides are produced by selectively altering, inactivating or augmenting these eryB and/or eryC genes and introducing them into polyketide-producing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gene cluster; bacterium; enzyme; macrolide; antibiotic; erythromycin; secondary metabolite; eryBII; eryCIII; eryCII; hybridisation; probe;

The erythromycin gene cluster spans approximately 53 kb and contains at least 20 open reading frames (ORF). This sequence contains the eryBlV, eryBV, eryCVI, eryBVI, eryBVI, eryCVI and eryBVII genes encoding ORFs 13, 14, 15, 16, 17, 18 and 19 respectively. A DNA representing the eryG-eryAIII region of the same

cluster is shown in AAX25772. The genes are used to produce hybrid secondary metabolites in S.erythraea, i.e. erythromycin analogues which may have improved properties or as hybridisation probes for isolating homologous genes involved in glycosylation of macrolactones in macrolide-producing strains (specifically oleandomycin-producing strains of Streptomyces antibioticus).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bordetella pertussis possesses a type III secretion system. Type III secretion systems allow bacteria to target virulence factors directly at host cells. A pathogenicity island is a compact, distinct genetic unit carrying virulence genes. The present sequence is a pathogenicity island from B. pertussis. The present sequence encodes a number of proteins involved in the type III secretion system of B. pertussis i.e. Bordetella pathogenicity protein. The proteins encoded by the present sequence may be used to treat or diagnose B. pertussis infection, e.g. as a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The present invention provides a number of nucleotide and protein are dequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analyshing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacterium are useful for producing main o acids, nucleic acids, vitamins, saccharides and organic acids, notes the present sequence is a nucleic acid described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                       Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene

Patent No. 6008201
GENERAL INFORMATION:
TITLE OF INVENTION: DNA Molecule Encoding for Cellular
TITLE OF INVENTION: Uptake of Mycobacterium Tuberculosis and Uses thereof
NUMBER OF SEQUENCES: 10
CORRESPONDENCE ADDRESS:
ADDRESSEE: Nixon, Hargrave, Devans & Doyle
STREET: Clinton Square, P.O. Box 1051

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 5, A Sequence 5, A Sequence 1, B Se

Another "orders nervous tunnor; Vector; puch8; Site_1: Smaf; Site_2: Smaf, A mini library was made by cloning products derived from cut-stress PCR (U.S. Letters Patent application No. 196,716 - Ludwig Institute for Cancer Research) profiles into the puch 18 vector. Reverse transcription of tissue mRNA and cDNA amplification were performed under low stringency conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.

/note="Wetcor: pBeloBAC11; Site_1: HindIII: Site_2:
HindIII; Rice is one of two most popular grains in the
world Half of the world population especially those
inhabiting highly populated areas of the humid tropics
and subtropics, rely on rice as their primary source of
carbohydrate. Monocotyledonous rice is a diploid plant
(2n-24) with a happioid genome equivalent of 4% Mpp
(Arumuganathan and Earle, 1991). The relatively small
genome of rice, three times larger than that of
Arabidopsis, makes it suitable for genomic studies. In
arbidopsis, makes it suitable for genomic studies. In
Arabidopsis, makes it suitable for genome constructed a BAC
library from oryza sativa, Nipponbare arivity. The
library contains 36,864 clones with an average insert size
of 1285 Kb providing 10.9 haploid genome equivalents. The
deep coverage allows the isolation a particular sequence
with a probability of 99.9%. Two high density litters,
each containing 18,432 clones (doubly spotted), represent
the whole library for colony screening."

/note="Vector: Lambda Uni 2AP XR, excised phagemid;
/germinated and grown aseptically in the dark at room
remperature on filter paper with water, nystutin and
cefotaxime in covered crystallization dishes. Five-day
old seedlings were transferred to 5 c cold room and kept
for 48 hr. The tissue, total RNA, and poly(A) kNA were
prepared, a cDNA library was made, and the CDNA clones
were in vivo excised to give pBluescript phagemids in the
full close lab (Choi, Close, Fenton) at the University of
California, Riverside. Plasmid DNA preparations and DNA
sequencing were performed in the OD Anderson lab (all
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /organism="Triticum aestivum"
